Base station power module parallel connection

Overview

Should I use two power modules in parallel?

Firstly, you may need more current than a single power module provides. Using two modules in parallel, the current to the load can be effectively doubled. Paralleling can also reduce the number of different power module types used, by meeting higher power requirements with lower power modules in parallel.

Why do I need a parallel power system?

A final reason is to reduce the number of different modules kept in stock by paralleling the same modules for different current and power needs across many program designs. This may also provide a lower cost advantage by earning higher quantity pricing discounts. However, not all modules can be paralleled.

Do module parameters influence current sharing and switching energy imbalance?

This understanding is important for proper module parallel operation inside the thermal and safe operation limits. This article describes the methodology of how to analyze the influence of module parameters on current sharing and switching energy imbalance for parallel operation of power modules.

Do paralleled modules have a minimum characteristic?

For this, it will be as-sumed that one of the paralleled modules has a minimum characteristic (resulting in maximum switching energy or current) while all other modules have the maximum characteristics (leading to minimum switching energy or current).

How many central gate drivers are used to control parallel modules?

Only one central gate driver is used in combination with a low-inductive interface board to control the paralleled modules. The reference test setup

was chosen for investigation of module parallel connection in the following chapters.

What affects static and dynamic current imbalance of power modules?

The interface of power modules, such as power connection on DC and AC side, the design of gate driver, and the gate driver connection to the power modules, have an influence on static and dynamic current imbalance of modules connected in parallel.
