Bidirectional energy storage inverter

Overview

What is a bidirectional inverter?

Unlike conventional inverters that only convert DC (direct current) to AC (alternating current), bidirectional inverters can also convert AC back to DC, allowing energy to be stored or fed back into the grid. This functionality is essential for applications like renewable energy systems, microgrids, and battery backup solutions.

Should you use a bidirectional inverter in a solar energy system?

Using a bidirectional inverter in a solar energy system offers several advantages: Bidirectional inverters allow for efficient two-way power conversion between AC and DC, enabling the system to charge batteries from both solar panels and the grid, and to supply power from batteries during outages.

Are bidirectional power conversion blocks a solution to energy storage challenges?

A potential solution to these challenges is bidirectional functionality for AC/DC, DC/AC and DC/DC power-conversion stages. To further increase system integration, system BOM and form-factor reductions, the landscape of grid systems that involve energy storage is moving toward bidirectional power conversion blocks like those shown in Figure 2.

What are bidirectional power conversion blocks & Hybrid inverters?

Bidirectional power conversion blocks and hybrid inverter solutions allow for reduced components, fewer modules and subsystems, and ultimately a lower system BOM cost. C2000™ devices for real-time control are purpose-built to meet designers' needs and help continue the growth of the energy storage market.

What is a bidirectional inverter stage?

The inverter stage is bidirectional, enabling power conversion from DC stage to AC stage and vice versa. The topology is constituted by an H-Bridge with each group of diagonal switches operating at high frequency during one half-wave of output voltage.

What is a bidirectional DC/DC converter?

As previously mentioned, the bidirectional DC/DC converter is an interleaved DC/DC converter with the capability to either work as a buck converter when charging the battery or work as a boost converter when charging the DC Bus, hence the DC/AC converter from the battery. The specifications for this stage can be seen in Table 3-2. Table 3-2.
