Coulombic efficiency of flow battery

Overview

What is the coulombic efficiency of an all-iron flow battery?

Thus, by operating at 60°C and a pH of 3 with ascorbic acid and ammonium chloride, we achieved a coulombic efficiency of 97.9%. While this value of coulombic efficiency is among the highest values reported for the iron electrode in the context of the all-iron flow battery, further improvement in efficiency is needed for supporting repeated cycling.

How Coulombic efficiencies are reduced in all iron flow batteries?

The earliest experiments on the all iron flow battery system deployed iron chloride solutions and a porous separator between the two electrodes. 11, 12 Such an arrangement resulted in unavoidable cross-diffusion of Fe (III) and Fe (II) between the positive to the negative sides of the cell and thus reduced the coulombic efficiencies.

What is Coulombic efficiency?

Coulombic efficiency (CE) is the ratio of discharge capacity to charge capacity within the same cycle. Since the CE of lithium-ion batteries is very close to 100% , it is hard to measure it precisely. The relationship between CE and SOC has a great influence on battery performance.

What is Coulomb efficiency of a lithium-ion battery?

The concept of the Coulomb efficiency of the lithium-ion battery is proposed. The Coulomb efficiency is usually used to describe the released battery capacity. It refers to the ratio of the discharge capacity after the full charge and the charging capacity of the same cycle. It is usually a fraction of less than 1.

How does temperature affect coulombic efficiency?

We found that increasing the operating temperature enhanced the kinetics of iron deposition relative to the kinetics of hydrogen evolution, leading to a net

rise of coulombic efficiency. Thus, by operating at 60°C and a pH of 3 with ascorbic acid and ammonium chloride, we achieved a coulombic efficiency of 97.9%.

How do electrolyte flow rates affect coulombic efficiency?

Elevation of pH near the surface of the electrode during electrodeposition also raised the coulombic efficiency. Thus, electrolyte flow rates significantly influence the coulombic efficiency. Ascorbic acid also served to regulate the pH near the surface of the negative electrode by buffering action.
