Do cylindrical lithium batteries need needle coke

Overview

Lithium battery anodes require needle coke with ultra-high purity (sulfur content $<0.5\%$, ash content $<0.1\%$), optimal crystallinity, and uniform particle distribution to ensure battery energy density and cycle stability. Why is needle coke a good anode material for lithium-ion batteries?

The rates and specific capacities of lithium-ion battery anodes are important factors used in evaluating the batteries. Needle coke is attracting attention as an anode material for lithium-ion batteries due to its high reaction rates, but its low specific capacity still remains a problem to be solved.

Does oxygen plasma treatment improve the electrochemical properties of needle Cokes-based lithium-ion batteries?

Oxygen plasma treatment enhanced needle cokes-based LIBs rate and specific capacities simply. High-rate capacities and specific capacities are important indicators for evaluating lithium-ion battery (LIB) anodes. To improve the electrochemical properties of needle coke-based anode materials, oxygen plasma treatment was used.

Can ozone treatment improve the discharge capacity of needle coke-based anodes?

Needle coke is attracting attention as an anode material for lithium-ion batteries due to its high reaction rates, but its low specific capacity still remains a problem to be solved. In this study, we attempted to improve the discharge capacity of needle coke-based anodes by introducing oxygen into the needle coke with ozone treatments.

Can ozonation increase the capacity of a needle coke battery?

Needle coke-based lithium-ion batteries with oxygen introduced through ozone treatment showed capacity increases of up to 17.4% and retention rates of 64.25% at 5 C. Therefore, introducing oxygen functional groups into needle cokes through ozonation is a viable strategy for producing rapid and high-capacity anode materials.

Are NF 3 plasma needle Cokes a fast charging anode material?

The NF 3 plasma treatment was identified as an effective way to improve the specific capacities, rates, and cycling stabilities of LIB anode materials; therefore, NF 3 plasma needle cokes have become fast charging anode materials with high stabilities and competitive capacities. 3.3. Mechanistic analyses.

Are needle Cokes a good carbon material?

Celzard et al. investigated the high conductivity of needle cokes (331.7 S/cm); this conductivity was significantly greater than those of natural graphite (197.0 S/cm) and artificial graphite (106.5 S/cm) . Therefore, needle cokes are considered attractive carbon materials.
