Energy storage fire power box

Overview

Can a lithium-ion battery energy storage system detect a fire?

Since December 2019, Siemens has been offering a VdS-certified fire detection concept for stationary lithium-ion battery energy storage systems.* Through Siemens research with multiple lithium-ion battery manufacturers, the FDA unit has proven to detect a pending battery fire event up to 5 times faster than competitive detection technologies.

What is energy storage & how does it work?

As the use of these variable sources of energy grows – so does the use of energy storage systems. Energy storage is a key component in balancing out supply and demand fluctuations. Today, lithium-ion battery energy storage systems (BESS) have proven to be the most effective type and, as a result, installations are growing fast.

What is lithium-ion battery energy storage?

Energy storage is a key component in balancing out supply and demand fluctuations. Today, lithium-ion battery energy storage systems (BESS) have proven to be the most effective type and, as a result, installations are growing fast. Stationary lithium-ion battery energy storage "thermal runaway," occurs.

What is an energy storage system (ESS) enclosure?

An energy storage system (ESS) enclosure typically comprises multiple racks, each containing several modules (Figure 1). These modules consist of numerous lithium-ion (Li-ion) cells, which function as rechargeable batteries designed to store and discharge electrical energy.

How long should a LFP battery be separated from a combustible object?

For LFP batteries with sprinkler protection, the minimum separation is 0.9 m (3 ft.) from non-combustible objects and 1.5 m (5 ft.) from combustible objects. The discharge duration must be at least 90 minutes.
