Overview

Solar photovoltaic (PV) panels are classified (or rated) by the power they produce under specific conditions. The most common ratings used in the industry are peak/STC, PTC, CEC-AC, and AC. What is the rated power of a solar panel?

The rated power of a solar panel is the maximum power that the solar panel can produce if everything is working at peak efficiency. For example, if the panel is rated at 200 watts, then the rated power is 200 watts, and that is the most power that the panel can create. Will it create that much power?

.

Do solar PV plants have a power rating?

Solar PV plants are made of a large number of solar panels, each of which carries a power rating based on the power generated in standard test conditions (STC). Simply adding the power ratings of all the panels in the plant does not (or should not) represent the nameplate capacity.

What does wattage mean on a solar panel?

You'll often see it referred to as "Rated Power", "Maximum Power", or "Pmax", and it's measured in watts or kilowatts peak (kWp). For example, the nameplate from my solar panel specifies a Wattage output of 100W, meaning that the solar panel is capable of producing 100 Watts of power under ideal conditions.

How much power can a solar panel produce?

For example, the nameplate from my solar panel specifies a Wattage output of 100W, meaning that the solar panel is capable of producing 100 Watts of power under ideal conditions. Manufacturers also provide an "Output/Power Tolerance" rating, showing how much the actual output can vary from the rated output.

What is the efficiency rating of a solar panel?

Most solar panels have an efficiency rating between 17%-23%. A solar panel with a 21% efficiency rating means it converts 21% of the sun's energy striking it into electricity. Do not confuse the efficiency rating with the rated output. A 23% efficiency rating does not mean the panel will only produce 23% of its rated output in watts.
