Can a PWM inverter suppress high-frequency oscillation of the island power system?

Based on the impedance model, the oscillation mechanism of the island power system is analyzed. On the basis of traditional dual-loop control, an impedance reconstruction control of the source PWM inverter is proposed, which can effectively suppress the high-frequency oscillation of the island power system.

What are the features of a high frequency inverter?

to operation at very high frequencies and to rapid on/off control. Features of this inverter topology include low semiconductor voltage stress, small passive energy storage requirements, fast dynamic response, and good design flexibility. The structure and operation of the proposed topology are described, and a design procedure is introduced. Exp.

What happens after adding impedance reconstruction control in a PWM inverter?

After adding impedance reconstruction control, the output voltages and currents of the source PWM inverter loaded with pure resistive load remain stable under different output power; when the load is a PWM rectifier, the high-frequency oscillation of the island power system is effectively suppressed.

Why is the island power system dangerous?

However, the island power system does not have the support of the utility grid, and the island power system is high-penetration of power electronics, which is prone to the “source-load interaction” oscillation problem, seriously affecting the safe and stable operation of the island power system. Fig. 1.

Are island power systems forging a path for larger interconnected power systems?

And because island power systems are often among the first to reach these very high instantaneous levels of wind and PV generation, we note that they are forging a path for larger interconnected power systems to follow. Need Help?

What is a 30 MHz 2 inverter?

of a 30 MHz  $\Phi 2$  inverter designed to deliver up to 520 W to a  $33.3\Omega$  resistive load and over an input voltage range between 160 V to 200 V. The semiconductor switch selected for this design is a 500 V vertical MOSFET (ARF521) which has an  $R_{ds,ON} = 1\Omega$  and an  $C_{OSS} = 55.42$  pF at  $V_{ds} = 160$  V. Details on the modelling of the semiconductor
