#### **Overview**

Do wind farms need energy storage capacity?

Considering the economic benefits of the combined wind-storage system and the promotion value of using energy storage to suppress wind power fluctuations, it is of great significance to study the optimal allocation of energy storage capacity for wind farms.

What is wind farm energy storage capacity optimization?

The goal of wind farm energy storage capacity optimization is to meet the constraints of smooth power fluctuations and minimize the total cost, including the cost of self-built energy storage, renting CES, energy transaction service, wind abandonment penalty and smooth power shortage penalty.

How can energy storage improve wind energy utilization?

Simultaneously, wind farms equipped with energy storage systems can improve the wind energy utilization even further by reducing rotary back-up. The combined operation of energy storage and wind power plays an important role in the power system's dispatching operation and wind power consumption.

How to reduce the cost of energy storage in wind farms?

Considering whole-life-cycle cost of the self-built energy storage, leasing and trading cost of the CES and penalty cost of wind abandonment and smooth power shortage, an optimal configuration model of combined energy storage capacity in wind farms based on CES service was established to minimize the total annual cost.

Why is energy storage important in wind farms?

In wind farms, the energy storage system can realize the time and space transfer of energy, alleviate the intermittency of renewable energy and enhance the flexibility of the system. However, the high cost limits its large-

scale application.

Which type of self-built energy storage is used in wind farms?

Battery has become the most widely used energy storage type at present because of its superior energy density . Therefore, it is assumed that the type of self-built energy storage in wind farms is the battery.
