What is a PV module?

PV modules are key components of a photo-voltaic system where sunlight is converted into direct current (DC) electricity. It consists of silicon cells absorbing sunlight and producing the DC power to charge your battery bank. If you are interested in PV modules, Chint Solar has the best products and components.

What is a photo voltaic module?

Photo voltaic modules are a packaged or unpackaged assembly of cells, substrates, and conductors for converting photon energy into direct current electrical power. The term “module” describes a die-cut piece of solar cell material that can be electrically interconnected to other modules as part of a photo-voltaic system.

What are the components of a solar PV module?

Here are the six components. Solar photovoltaic cells are the main components of a PV module. There's a thin layer, just a few micrometers thick, of a semiconductor material such as silicon on which photons are striking the surface to liberate electrons that can be collected at electrodes attached to the top and bottom surfaces.

How many Watts does a photovoltaic module consume?

A photovoltaic module in this example uses 150 Watts. On the outside of the housing you see the module and a power outlet.

What is a standard 230 volt solar power outlet?

A standard solar power outlet for 230 volts is suitable for most plugs in Europe. It comprises a switch and a waterproof cover. This outlet can be placed on a place exposed to the sun. If you use a cable reel, you get 4 outlets at the distance of 10 meters.

Why should you choose solar PV module?

Due to environmental concerns and depleting fossil fuel reserves, the technology stands to gain attention worldwide. Many countries aim towards solar PV module as a means of cheap, clean, and reliable power for utility, industry, and individual purposes.
