#### **Overview**

What are the different types of novel Flow batteries?

Recently, researchers have explored different types of novel flow battery systems, including aqueous and non-aqueous systems. The purpose of studying novel non-aqueous flow batteries is to improve the voltage of flow batteries, and the purpose of studying novel aqueous flow batteries is to decrease costs and improve energy density.

What is a flow battery?

Flow batteries have received increasing attention because of their ability to accelerate the utilization of renewable energy by resolving issues of discontinuity, instability and uncontrollability. Currently, widely studied flow batteries include traditional vanadium and zinc-based flow batteries as well as novel flow battery systems.

Why is flow battery research important?

Overall, the research of flow batteries should focus on improvements in power and energy density along with cost reductions. In addition, because the design and development of flow battery stacks are vital for industrialization, the structural design and optimization of key materials and stacks of flow batteries are also important.

What is the current density of flow battery stacks?

However, the working current density of flow battery stacks is currently relatively low (around 80 mA cm -2), resulting in comparatively low power densities, increased consumption of materials and high costs, limiting the large-scale application of flow battery systems.

Which agueous flow batteries are the most promising?

Therefore, the most promising systems remain vanadium and zinc-based flow batteries as well as novel aqueous flow batteries. Overall, the research of flow

batteries should focus on improvements in power and energy density along with cost reductions.

How do we design a flow field for flow-through aqueous organic redox flow batteries?

We design a flow field for flow-through type aqueous organic redox flow batteries (AORFBs) by placing multistep distributive flow channels at the inlet and point-contact blocks at the outlet, to achieve a uniform and adequate electrolyte supply at the electrode.
