Uninterruptible power supply periodically switches

Overview

What is an uninterruptible power supply system?

Uninterruptible Power Supply System When utility mains are not available, electricity can be supplied from a source such as a standard connected equipment UPS, which provides power supply. UPS is mostly used for critical loads and is kept between commercial utility mains.

What is an uninterrupted power supply (UPS) system?

Uninterruptible power supply (UPS) systems are defined as systems that provide uninterrupted, reliable, and high-quality power for sensitive loads, such as medical facilities, data storage, and telecommunications.

How do uninterruptible power supplies (UPS) mitigate voltage sags?

Uninterruptible power supplies (UPS) mitigate voltage sags by supplying the load using stored energy. Upon detection of a voltage sag, the load is transferred from the mains supply to the UPS.

What type of power switch is used in a UPS system?

Systems with ratings less than 200 kVA now use power transistors or insulated-gate bipolar transistors as the power switches. Fig. 63 shows a circuit diagram for a UPS system using a three-phase, pulse-width-modulated inverter supplied from a battery and feeding a transformer and filter. The transformer provides isolation and voltage matching.

How do UPS systems work?

Such UPS systems use energy storage technologies such as batteries or flywheels to provide power to loads in the absence of applied power. Typically, static power electronics such as fast-switching high-current insulated gate bipolar transistors (IGBTs) are used to convert power.

Why do you need a rechargeable battery for a UPS system?

David G. Dorrell UPS systems are used to provide reliable and uninterruptible power for critical loads by transferring power supply from the utility to backup energy storage when a power disruption occurs. Rechargeable batteries are always the primary choice owing to their comparatively high energy density.
